DATA- 332

Professor John Brosius

April 20, 2025

For this project, I had to make a lot of changes to clean and combine the different car data files. Every group had its own way of naming columns, so I had to rename them to be the same (like changing “MPH” and “Speed (mph)” to just “Speed”). Some files didn’t have certain information like time or temperature, so I added those columns with NA values to keep things consistent. I also added a column to show which group each row came from. After combining everything, I uploaded the final data to my GitHub and used R to call it from there, which helped save space and keep things organized.

One of the biggest challenges was just how different the files were. Some had extra header rows, while others had merged cells or missing columns, so I had to fix those before I could use them. After cleaning the data, I had to redo some of the charts, especially the ones about car types and speed, because the new combined data looked different than before. This assignment taught me how important it is to stay consistent when collecting data, and how small differences can cause big issues later on. I also learned how helpful it is to keep everything clean and clearly labeled from the beginning.
